IOW Group

 **visit** IOWGroup.com

The IOW Group provide a full range of positive displacement triple screw pumps that exceed the qualities of market leading products and the expectations of customers.

All pumps fit industry standard footprints and flanges for easy installation.

Mechline or Magnaline?

The choice is yours

Mechline A like for like replacement

Mechline is a mechanically sealed pump that minimises leaking during operation.

The mechanical sealed pumps are financially more economical, due to the shaft seal design.

The main difference of the mechanically sealed pump is it's designation of high or low temperature, with the pump designed to be coupled directly to an electric motor of flange type. The pump is fitted with a pressure relief valve.

Magnaline Superior and leak free

Magnaline is a hermetically sealed pump that is completely leak free, requiring very low maintenance.

As this type of pump contains no seals they are very reliable and require very low maintenance plans, which keeps costs to a minimum. Installation is also very easy as alignment between pump and motor is achieved using guide pins. The pump is fitted with a pressure relief valve.
